J.A.R.V.I.S.

Just A Rather Very Intelligent System

The world's first truly autonomous AI assistant that doesn't just answer questions - it takes action.

Investor Information Document

April 2026

Inspired by Tony Stark's AI from Iron Man - Now Real

What is JARVIS?

Imagine if you could talk to your computer like Tony Stark talks to his AI in Iron Man - and it actually does things for you. That's JARVIS.

The Problem: Today's AI assistants (Siri, Alexa, ChatGPT) can only talk. They can't actually DO things on your computer, control your home, or take real action. They're just fancy search engines that speak.

Our Solution: JARVIS is an AI that can execute code, control devices, browse the web, send emails, make phone calls, automate tasks, and literally do anything a human could do on a computer - all from a simple conversation.

Unlimited

Possibilities

"The difference between JARVIS and ChatGPT is like the difference between reading about how to drive and actually getting in the car."

The Magic: AI That Fixes Itself

Here's what makes JARVIS truly special - it writes its own code and solves problems you never anticipated.

Real Example: Connecting a TV

A user asked JARVIS to "play music on the living room TV." The TV wasn't in the system. Here's what happened:

Step 1: Discovery

JARVIS scanned the home network and found an unknown device at IP 192.168.4.25

Step 2: Identification

It probed the device, discovered it was a Technicolor Fision TV using the DIAL protocol

Step 3: Research

JARVIS searched the web to learn how DIAL protocol works

Step 4: Integration

It wrote new code to communicate with this TV type, tested it, and saved it for future use

Step 5: Memory

JARVIS remembered this device permanently - next time, it just works

No human programmer was involved. JARVIS taught itself.

This Happens Constantly

When JARVIS encounters a missing software package, it installs it automatically. When an API changes, it adapts. When a new device appears on your network, it figures out how to control it. This isn't scripted behavior - it's genuine problem-solving.

What Can JARVIS Actually Do?

See Everything

Real-time screen vision plus camera feed. JARVIS can see what you're working on and the physical world around you. Ask "what's on my screen?" or "who's at my door?" and it knows.

Control Your Home

Sony TVs, Roku, Sonos speakers, smart lights, network devices - JARVIS controls them all through natural conversation. "Play jazz in the kitchen" just works.

Run Any Code

Python, JavaScript, PowerShell, Bash - JARVIS writes and executes code in real-time. Need to process data? Build a website? Automate a task? Just ask.

Browse & Research

Full web browsing with Puppeteer automation. JARVIS can search, read articles, fill forms, and extract information from any website automatically.

Communicate For You

Send emails, make phone calls (via Twilio bridge), manage calendars, send notifications to your phone. JARVIS is your communication hub.

Create Content

Generate AI videos with Luma AI, create images, build websites, write documents. JARVIS is a full creative suite controlled by voice.

Manage Files

Read PDFs, organize documents, search through

Remember Everything

Persistent memory across sessions. JARVIS remembers

folders, process data files. Your entire file system is accessible and manageable through conversation.

your preferences, contacts, projects, credentials, and learns from every interaction.

Real Conversations, Real Results

User: "Check my Gmail and tell me what's important"

JARVIS: Connects to Gmail API, reads inbox, analyzes content, summarizes the 3 most urgent emails with recommended actions.

User: "Build me a website for my business"

JARVIS: Creates HTML, CSS, JavaScript files, saves them to the web server, downloads images, and opens the finished site in your browser - all in under 2 minutes.

User: "Set up a conference call with John and Mary"

JARVIS: Uses Twilio to call you first, then bridges in John and Mary from your contacts. You're in a 3-way call within 30 seconds.

User: "What am I looking at?" (points camera at document)

JARVIS: Analyzes camera feed, reads the document, extracts key information, and can take action on it (file it, summarize it, email it to someone).

User: "Every morning at 8am, brief me on my day"

JARVIS: Saves this as a daily task, then autonomously checks email, calendar, weather, and news every morning, sending a

proactive notification with your personalized briefing.

Key Insight: These aren't pre-programmed responses. JARVIS figures out HOW to do each task in real-time using web searches, code execution, and tool chaining.

How Does It Work? (Simple Version)

JARVIS combines a powerful AI brain with a toolkit of real-world capabilities:

Component	What It Does
AI Brain	Understands what you want, plans the steps, makes decisions
Code Engine	Writes and runs programs instantly (Python, JavaScript, etc.)
Vision System	Sees your screen and camera feed in real-time
Web Browser	Searches, reads, and interacts with any website
Device Controller	Communicates with TVs, speakers, smart home devices
Communication Hub	Email, phone calls, calendar, notifications
Memory Bank	Remembers everything across sessions

The Secret Sauce: Tool Chaining

JARVIS doesn't just use one tool at a time. For complex tasks, it chains multiple tools together automatically. Need to "find the cheapest flight to Miami and email me the options"? JARVIS will:

1. Search the web for flight comparison sites
2. Use browser automation to check prices
3. Write code to organize the data
4. Compose an email with the results
5. Send it to you via Gmail API

The Market Opportunity

$150B+

AI Assistant Market by 2030

4.2B

Voice Assistant Users Worldwide

Why Now?

- Large Language Models (GPT-4, Claude) finally smart enough to reason and plan
- API ecosystem mature enough for real integrations
- Smart home adoption at all-time high
- Remote work created massive demand for productivity tools
- People are TIRED of AI that only talks - they want AI that DOES

Competitive Landscape

Product	Can Talk	Can See	Can Execute Code	Can Control Devices
Siri / Alexa	Yes	No	No	Limited
ChatGPT	Yes	Yes	Sandboxed	No
Google Assistant	Yes	No	No	Limited

JARVIS	Yes	Yes	Full Access	Unlimited

The Vision: Where We're Going

Phase 1: Personal Assistant (NOW)

Desktop application for power users, developers, and productivity enthusiasts. Prove the technology works.

Phase 2: Business Edition

Enterprise deployment with team features, security compliance, and business integrations (Salesforce, Slack, etc.)

Phase 3: Platform

Third-party developers can build "skills" for JARVIS, creating an ecosystem of capabilities

Phase 4: Everywhere

Mobile apps, wearables, car integration, AR glasses. JARVIS becomes your universal interface to technology.

"We're not building a better chatbot. We're building the last interface you'll ever need."

Long-Term Impact

Imagine a world where technology barriers disappear. A 70-year-old grandmother can manage her smart home, online banking, and video calls just by talking naturally. A small business owner can automate their entire operation without hiring IT staff. A student can have a research assistant that actually does the research.

JARVIS democratizes access to computing power. You no longer need to know HOW to do something on a computer - you just need to know WHAT you want done.

Investment Opportunity

Use of Funds

40% - Engineering

Expand the development team, improve core AI capabilities, build mobile applications

25% - Infrastructure

Cloud computing, API costs, security infrastructure, scaling systems

20% - Go-to-Market

Marketing, user acquisition, partnerships with smart home manufacturers

15% - Operations

Legal, compliance, customer support, general operations

Revenue Model

Tier	Price	Features
Personal	$29/month	Full JARVIS capabilities for individual use
Professional	$79/month	Advanced integrations, priority support, more compute
Enterprise	Custom	Team deployment, security features, dedicated support

Join the Future

We're looking for visionary investors who understand that AI is about to make a giant leap - from talking TO doing. JARVIS is that leap.

Contact: nadav@jarvis.ai

Why JARVIS Will Win

- **First Mover Advantage:** No one else has built a truly autonomous AI assistant with full code execution and device control
- **Self-Improving:** JARVIS gets better with every interaction, learning new capabilities automatically
- **Network Effects:** Each new device, API, and integration makes the platform more valuable for everyone
- **Technical Moat:** The architecture for safe, autonomous code execution took years to develop
- **Cultural Moment:** Everyone knows what JARVIS is from Iron Man - instant brand recognition

The Bottom Line

For 50 years, we've adapted to computers - learning their languages, their interfaces, their limitations. JARVIS flips that relationship. The computer finally adapts to us.

This isn't incremental improvement. This is a fundamental shift in how humans interact with technology. And we're building it right now.
